A personal proving ground.

Capability, edge and confidence, with the seriousness of working with real money.

metten

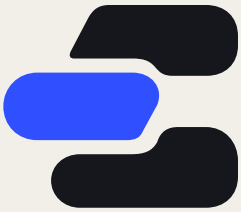

Metten takes its name from Connor's grandmother's maiden name. The strong wordmark and offset Modular pieces carry the personality; surrounding interfaces stay quiet and readable.

The system

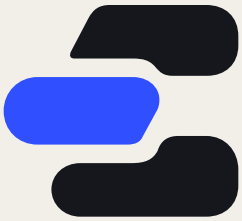

A / Main

48 CSS px and up

B / Small

24-47 CSS px

B Micro / Tiny

16-23 CSS px

Owner-selected: Metten, A/B direction, current cobalt, actual Clash lettering and t spacing, Inter, the equal-gap placement and the 240px responsive header.

Designer specifications completed under delegated authority: clear space, digital size routing, B Micro adoption and no tagline for this release. This completes the delegated digital usage specifications; product integration remains separate.

One geometry. Four treatments.

Use these combinations. Keep all paths, spacing and contours shared across colorways.

Primary / ink + cobalt on chalk

Reversed / chalk + cobalt on ink

One color / ink

One color / chalk on cobalt

The local flat channels match numerically. Contrast and rasterization can still change perceived spacing; do not make separate theme-specific redraws.

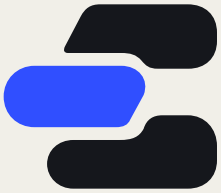

Choose the role by display size.

CSS canvas size chooses the geometry. Physical raster resolution chooses the density.

A / 48px and larger

At a 48px square canvas: about 36.8 × 29.7px visible.

B / 24-47px

At 24px: about 18.4 × 15.9px visible.

B Micro / 16-23px

At 16px: about 14.0 x 12.7px visible.

Full lockup: 240px minimum visible artwork width. The supplied SVG canvas is about 255.42px at that placement. Wordmark-only: 160px minimum visible width.

Prefer SVG. B Micro's 16@2x PNG contains 32 physical pixels but is displayed at 16 CSS pixels; it does not become the 32px B role. No supplied symbol is specified below 16px.

These illustrations are enlarged vectors. Use proofs/size-lab.html and the pixel proof pages for actual-size and density evidence.

Give the mark room.

Clear-space unit x is half the center-piece height.

x = 30.30435 master units

Keep at least x beyond the visible artwork on all sides of a normal symbol or lockup. x is about 14.4% of A's visible symbol width. It does not change internal symbol-to-wordmark spacing.

Tiny-icon packing exception

B Micro uses about 1px of internal horizontal tile padding at 16px. Apply separation outside its tile. Do not squeeze A or B to imitate the micro crop.

Approved headers use about 240px visible logo width: 20px vertical / 28px horizontal padding on desktop; 20px above / 16px at the sides on phones, with navigation below.

Color and type do distinct jobs.

The current digital palette is retained; no print conversion is implied.

Cobalt

Clash in the logo. Inter for reading.

Built around evidence.

Connor's personal proving ground for building profitable bots on Kalshi.

Illustrative data / Filled 18 of 24 / Average 47.20

Inter 400 / reading 500 / labels 600 / headings

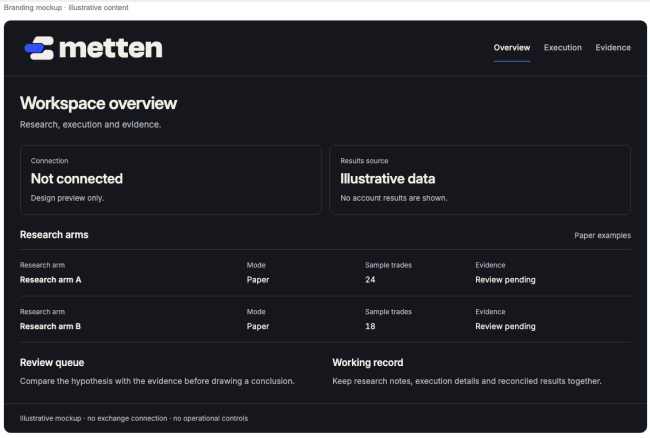

16px body, 14px interface, 12px secondary labels. Use tabular lining figures for aligned data. The logo retains actual Clash outlines and the extra 0.03em after the first t.

Contrast: ink/chalk 15.58:1; chalk/cobalt 4.95:1; cobalt/ink 3.15:1. Keep cobalt on ink for the mark or indicators, not small body text. Operational state also needs words or another cue.

No tagline, founder positioning, startup pitch, performance promise, logo stretch, shadow or independent recoloring in this digital system.

Ready for a separate integration.

Actual offline mockup renders, reduced for this page. All UI and data are illustrative.

One header logo. Plain navigation.

The same outline artwork and type pairing carry from desktop to phone. Interfaces adapt to width; the brand is not repeated beside every label.

Delivery

One editable SVG master; matching SVG, vector PDF and transparent PNG exports; readable guide; exact usage specifications; license references; evidence and a bounded handoff.

Limits

Physical iPhone/Safari, other editors, T3 custom icons, print production and independent backup of the full Scratch archive are not certified. Product integration, publication and runtime actions remain separate.
